

Security risk assessment report

Part 1: Select up to three hardening tools and methods to implement

Port filtering
Password policies
Multifactor authentication (MFA)

Part 2: Explain your recommendations

The reason why I recommend this and would implement it is that, based on the vulnerabilities, it shows that these tools and security methods would have helped prevent the attack and would have made it harder for the attacker to access the information, since the company didn't have these steps taken, which would reduce the likelihood of unauthorized access or delay it.
